

21/12/2020

Three pilot tests in Paris, Athens and Turin are getting underway in the first few months of 2021 to get citizens involved in defining policies and taking public decisions which are usually taken by administrations, institutions and entities. They will be doing so within the framework of the European research project CO3. Transformative impact of disruptive technologies in public services, which has developed a digital platform for interaction among the different stakeholders involved in citizen participation processes, and via the use of disruptive technologies based on co-creation, co-production and co-management methodologies which engage all the parties affected. In 2020, the second of the project's three years, the software which will serve as the basis of each specific participative action was developed, and after initial testing, the pilot tests are now expected to get underway.

The CO3 project, led by the Università di Torino (Italy) is an interdisciplinary project that includes entities, companies and research centres in Greece, Italy, France and Spain.

The second year of CO3, 2020, has been wholly spent on developing the software underlying the platform where institutions and citizens will interact, which is now in the final co-production phase. Throughout this year, the developers of the disruptive technologies have delivered the software, which is comprised of ten modules, four of them visible and six of them invisible to users, which makes it incredibly flexible.

Despite the fact that the development team has undertaken the first usability testing of the application this winter, the third phase of the project will get underway next year, in which the software will be implemented in three pilot tests in Athens, Paris and Turin. Some of these adaptations to practical, specific and real cases were supposed to launch this autumn but were delayed because of the COVID-19 pandemic.

The researchers view this past year positively overall. Even though some of the project's actions have had to be postponed because of the pandemic, all the partners involved have been able to continue working online, and even though it hasn't been the ideal situation, the most important thing is that we have been able to make headway in the development. During the pandemic, this work process has proven to be a drawback that has forced some of the scheduled participation activities to be cancelled, transformed or postponed.
